Introduction

The National Industries Company is keen on presenting new developments in concrete paving interlocking and flags of all kinds. We are always keen on adding new shapes and presenting creative ideas in design. This allows for a wider choice between different forms of pavers to meet all tastes.

Pavers are available in thickness 60mm and 80mm.

It is worth to mention that National Industries Company has achieved the International Environmental Product Declaration (EPD) Standard for its interlocking tile products.

NIC Tiles Colors

All raw materials including the pigments used are chosen after testing to the specific standards in the company laboratory. It gives durable and quality products with stable color.

Note:

- Minor color variation may be noticed due to the continuous mixing process during production, which is usual in this industry.
- Efflorescence is a global natural phenomenon. It is temporary and does not affect the quality of the product.
- **The colors in the catalogue are not identical to the real colors of the product. We recommend to inspect the samples before purchasing.**

INTERLOCK TILES

Lotus

71308

- Thickness: 6 cm
- Weight: 4 kg
- 35 pieces/m²

Uni Decor

90209

- Thickness: 6 or 8 cm
- Weight: 3.64 kg or 4.72 kg based on the thickness
- 39 pieces/m²

Technical Specifications

According to the Kuwaiti standard specifications, the interlocking tiles must achieve a compressive strength for the average sample equivalent to 35 Newton/m² for medium use and 50 Newton/m² for heavy use after 28 days of production.

NIC interlock tiles achieves the limit stipulated in the specifications after three days of production for medium load to a week for heavy load, and reach a higher endurance strength after only 28 days of production.

Rectangular

- Thickness of 6 cm weights 2.8 kg
- Thickness of 8 cm weights 3.7 kg
- Thickness of 10 cm weights 10.6 kg
- 50 pieces/m²

Murouj Tiles

- Thickness: 6 cm
- Murouj Tiles consist of Octagonal and Square tiles 10x10cm
- Octagonal Tile Weights 6.4kg
- Square Tile Weights 1.4kg
- 17.2 pieces/m² of Octagonal and same of Square

Square Tiles

Available dimensions:

- 8x20x20 with a weight of 7.3 kg per piece and 25 pieces per square meter 71315
- 6x20x20 with a weight of 5.7 kg per piece and 25 pieces per square meter 50209

- 6x10x10 with a weight of 1.40 kg per piece and 100 pieces per square meter

Tile 3D

- Thickness: 6 cm
- Weight: 1.9 kg
- 72 pieces/m²
- Usually used with 15x15cm square tiles so that the tile ratio of 3D Tiles to Square Tiles is 59%:41%.

- 6x15x15 with a weight of 3.1kg per piece and 45 pieces per square meter

Paver Installation

1. Type of paving & kind of slabs

- Determine type & shape of paving (Refer to 5) to determine kind & quantity of slabs needed.

2. Preparation of the ground

- Level the ground to the required slope after removing the odd materials like stones, construction debris, etc.
- Spray the soil with enough quantity of water. Then plough it and mix. Remove any odd materials.
- Compact the soil, using suitable compaction equipment. 95% proctor is required for parking areas and 93% for the pedestrian areas.
- Spread a layer of 5-10cm of clean coarse wet sand.

3D Paver

50210

- Thickness: 6 cm
- Weight: 3.65 kg
- 39 pieces/m²

Diamond

71303

- Thickness: 6 cm
- Weight: 2.53 kg
- 56 pieces/m²

Zigzag

50206

- Thickness: 6 or 8 cm
- Weight: 2.6 kg or 3.35 kg based on thickness
- 55 pieces/m²

Romantic Paver

Regular: 91601 - Wavy: 91651

- Thickness: 6 cm
- Weight: 4.2 kg
- 34 pieces/m²

Large Wave Paver

91401

- Thickness: 6 cm
- Weight: 7.9 kg
- 18 pieces/m²

Small Wave Paver

91301

- Thickness: 6 cm
- Weight: 3.94 kg
- 36 pieces/m²

3. Paving

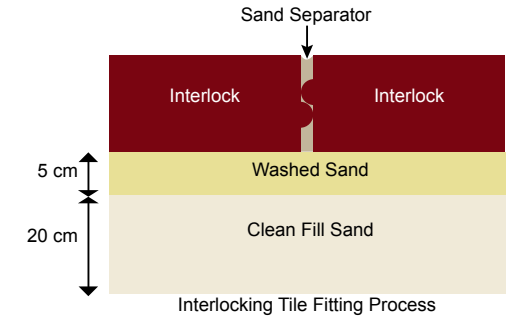

- No mortar or grout to be placed under the pavers as this will cause pointed stress concentration causing cracks in the slabs.
- Lay the pavers to the required level and slope using wood or rubber hammer to tap the surface or on side of the pavers. (Refer instruction 8, regarding the starting blocks, edges and corners.)
- Generally 60mm slope is required for every 3Mtrs, to allow the rain water to drain freely.

Star Shape

90204

- Thickness of 6 cm weights 3.5 kg
- Thickness of 8 cm weights 4.6 kg
- 40 pieces/m²

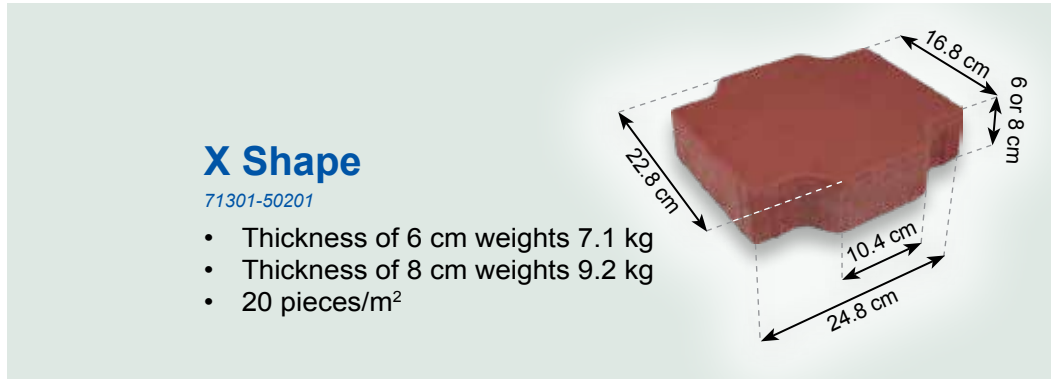

4. Paving excess areas

Proceed with any one of the following method for the starting and the excess areas between the pavers and edge restrains such as walls, kerbstone, manhole, etc.

1. Check with NIC for the part blocks suitable for the starting and the excess areas.
2. If the part blocks are not available cast the excess areas with concrete as follows:-
 - a. Remove the sand layer.
 - b. Spray the soil with water.
 - c. Cast with concrete of strength not less than 25N/mm². Use suitable method to vibrate and compact the concrete to the required slope and level of pavers.

5. Joint filling:

Gap width less than 5mm. Place a thin layer of dry clean sand of size not more than 3mm over the paved area. Broom in all directions to fill the gaps and then spray water. Repeat it to fill the gaps completely.

X Shape

71301-50201

- Thickness of 6 cm weights 7.1 kg
- Thickness of 8 cm weights 9.2 kg
- 20 pieces/m²

Cobble

91112

- Thickness: 6 cm
- Weight: 5.7 kg
- 25 pieces/m²

Garden Paver

- Thickness: 8 cm
- Weight of the piece: 5.85 kg
- 25 pieces/m²

Hexagon

71312-50202

- Thickness: 6 or 8 cm
- 6 cm Thickness weights 4.7 kg
- 8 cm Thickness weights 6.15 kg
- 30 pieces/m²

Honey Comb

90205

- Thickness: 8 cm
- Weight: 5.2 kg
- 35 pieces/m²

Half Hexagonal

- Thickness: 8 cm
- Weight: 9.68 kg
- 19 pieces/m²

I Shape

71307-50207

- Thickness: 6 or 8 cm
- 6 cm Thickness weights 3.4 kg
- 8 cm Thickness weights 4.4 kg
- 41 pieces/m²

6. Compacting with Vibrator

Using the Mechanical Vibrator:

A mechanical vibrator is used on the tile surface to ensure complete compaction of sand between the tiles and to level the overall surface. A layer of fine sand (passing through a 3 mm sieve) must be placed between the tile surface and the vibrator to fill gaps and prevent scratching. After vibrating, excess sand is swept off the surface.

Minor surface scratches on interlocking tiles are normal due to the movement of a 60 kg steel roller over the surface. These scratches can vary depending on the surface evenness—higher areas experience more friction. To minimize this, the roller can be omitted in areas without vehicular traffic. Instead, joints can be filled manually by sweeping sand into the gaps, followed by surface cleaning. Avoid using water on the tiles.

Important Note:

Under no circumstances should wet mortar be mixed or applied on the tile surface to preserve its finish..

Lee Stone

50216

- Weight: 10.2 kg
- 22 pieces/m²

Remarks:

- During winter, white spots may occasionally appear on the surface of cementitious products. This is a natural phenomenon known as temporary efflorescence, which occurs within the first year and disappears over time without affecting the product's specifications or quality.
- When using coarse sand (not passing through a 3 mm sieve), the tile surface may experience wear. This is due to the coarse sand containing gravel-sized particles (up to 3/16») that cause abrasion when in contact with the tile surface under the pressure of a roller.
- Installing tiles without leaving a minimum gap of 5 mm between them can result in misalignment of the tile rows.
- Expansion joints must be provided at intervals of 7-9 meters in both directions to prevent cracking at the corners and edges due to the lateral pressure caused by natural expansion and contraction of the tiles.
- Cutting any of the products may result in a variation in color tone.

Basalt-Patterned Tiles

These tiles are characterized by their rough texture, achieved through a mechanical roughening process. This technique creates a natural variation in surface texture and appearance, evoking the luxurious feel of basalt or honed marble.

Available in beige and cement grey colors.

Basalt-Patterned 10x10x8

50214

- Weight: 1.85 kg
- 100 pieces/m²

Basalt-Patterned 20x10x8

50215

- Weight: 3.6 kg
- 50 pieces/m²

Basalt-Patterned 30x10x8

50222

- Weight: 5.5 kg
- 34 pieces/m²

Basalt-Patterned 30x20x8

50212

- Weight: 11 kg
- 17 pieces/m²

Antique Tiles 2

51701

- The set is formed of 7 pieces
- The full set area is 80x120 cm
- Thickness: 6 cm

Wet Cast tiles

Technical Specifications:

In accordance with the Kuwaiti standards, the compressive strength achieved by interlock tiles is equivalent to 35 N/mm² 28 days after production.

- This type of tiles is manufactured in accordance with the Kuwait standards (KSS 222/2004).
- The same is manufactured with a density equivalent to 2.35 kg/cm³.

The wet cast products have the following specifications:

- Smooth surface that does not include any gaps
- High rate of compaction and less absorption of moisture
- Negligible surface erosion rate

Tile Y

71313

- 25 pieces/m²
- Weight: 5.670 kg/piece

Colors used in Wet Cast tiles

Cement

Brown

Beige

Light orange

Light yellow

Remarks:

- A slight difference may be noticed in the color grade due to the continuous mixing process during production. This is considered normal.
- The phenomenon of salting is a natural and temporary phenomenon and does not affect the quality of the product.
- **The colors in the catalogue are not completely identical to the real colors of the product; therefore we recommend that you inspect the samples before purchasing them, without depending on the colors in the catalogue.**

Yard Tiles

Technical Specifications

In accordance with the British Standard (BS EN 1339/2003), the tile size 60x400x400 mm should achieve the limit set forth in the specifications 28 days after production as follows:

Transverse strength: not less than 3.5 N/mm² for any sample.

The tiles of the National Industries Company achieve the stipulated strength in the specifications after one week of production. It reaches the highest strength stipulated in the specifications 28 days after production only.

The thickness of the tile for public squares that is smoothed is less than the regular tile thickness by 5 mm.

Yard Tiles Paving

1. Type of paving & kind of slabs

Determine type & shape of paving (Refer to 5) to determine kind & quantity of slabs needed.

2. Preparation of the ground

1. Natural soil should be leveled to the slope and level required.
2. Remove away all odd materials like (stones, debris etc ...,).

3. Spray the soil with enough quantity of water then plough it and mix, during this work also remove odd materials (as in 2 above.)
4. Compact the soil using suitable compaction equipment (refer to side table) to reach degree of compaction as follows: For Parking areas Proctor 95% and Pedestry areas Proctor 93%.
5. A layer (5 - 10 cm) of coars clean and wet sand to be spread over the compacted soil.

3- Paving

1. No mortar or grout to be placed under the slabs as this will cause points of stress concentration causing cracks in the slabs.
2. Lay the slabs and level to the required level and slope using wood or rubber hammer to tap on surface or on side of the slabs to place in position. Regard slab edges and corners (refer to instruction in 5 follows). Suitable slope of paving surface if not determined is 60mm. for each 3 mt. (2% slope) to allow flow out of rain water.
3. Leave to the end of paving the excess areas need part of slab and use the following for paving.

4. Paving excess areas

In case of excess areas remain between slab and (walls, kerbstone, manholes, trees etc.) proceed using one method of the following:

1. Refer to the slab producer for parts of slabs of less width and suitable for the width of the excess areas. If these slabs are not available, proceed with the following.
2. Cast the excess areas with concrete as follows:
 - a. Remove away the sand layer.
 - b. Spray the natural soil with water.

- c. Cast with concrete of strength not less than 25 N/mm². Use suitable method to vibrate or compact the concrete and then level to the required level or slope of the slabs.
- d. Use suitable method to cure the concrete

5. Paving types

Different pattern and types of paving are shown in this brochure. Each type of paving needs special method to finalize the paving operation as follows:

- 1- Paving without mortar between slabs (refer to drawing).
 - a- Gap width less than 5 mm. Spray dry clean sand of not more than 3mm size over the paved area, then broom in all directions to allow the sand enter in the gaps between the slabs, and then spray water. To fill the gaps repeat the same after sand over the surface of slabs gets dry.
 - b- Paving in gardens where gap between slabs is 5-15 cm. To grow grass. After completing slabs laying, remove the sand layer in the gaps. Then fill with soil mixed with fertilizer and seeds.

2- Paving with mortar.

Mortar between slabs should be of good quality (cement/sand 1:3)

Tile dimensions

The Industries tiles are available in different dimensions. The following are the main available dimensions:

- 65x400x400 mm for unsmoothed tiles
- 60x400x400 mm for smoothed tiles
- 50x400x400 mm
- 65x500x500 mm

Remark: all dimensions may be surpassed by 3 mm.

a- Gap less than 5 mm.

Spray the dry mortar over the surface of slabs, broom the mortar in all direction to allow it enter in the gaps.

Remove the excess mortar from top of labs surface. Spray the gaps with water to allow for cement reaction. NB: Mortar is not recommended in this case, paving without mortar is highly recommended.

b- Gap width is 5 - 15 mm.

Pieces of ply wood of thickness equal to the width of the gap required between the slabs to be put during the laying of slabs. At the end of laying operation, ply wood pieces to be removed and fill the gaps with soft mortar using suitable funnel. The surface of the mortar in the gap is 5 - 7 mm less than the edge of the slabs. In case of using chamfered slabs, the surface of the mortar must not be higher than the lower edge of chamfering.

NB:

it is not recommended to mix or place the wet mortar on top of slabs and move it to fill the gaps.

6- Expansion joints

Depends on the design but expansion joints can be constructed at distance of 9- 12 mts. Such joint must be filled with good quality material to allow expansion and contraction of the slabs without failure of the material.

TERRAZZO SLABS

3303

Terrazzo slabs are among the most in-demand construction materials in the local market for flooring, walls, and facades. They are prized for their durability and aesthetic appeal, as well as their water resistance when paired with appropriate adhesives. Additionally, they are easy to clean and environmentally friendly.

SPECIFICATIONS

Terrazzo tiles are manufactured using fully automated hydraulic machines, ensuring the final product complies with the European Standard BS 4131:1973 and the Kuwaiti Standards KSS 36189/ and KSS 36289/.

The tiles are composed of hydraulically compressed concrete units, subjected to 180-200 bar of pressure uniformly across the surface, resulting in a strong, dense product comparable to natural stone.

White or black cement meeting the ASTM C-150 standard or as per customer requirements.

Marble chips (1.52.5- mm) and marble powder (00.8- mm) to achieve the desired monochromatic terrazzo finish.

Technical Specifications:

Water Absorption: $\leq 8\%$

Breaking Strength: $\leq 3 \text{ N/mm}^2$

Density: 2260 kg/m^3

Technical Properties

As per the British standard specifications (BS EN 1340/2003), the fencing brick should be as per the limits indicated in the specification after 28 days of production which are as follows:

- Transverse Strength should be in minimum 3.5 Newton/ mm² for each of the samples.
- The strength of the NIC Bricks is as per stated in the specifications after one day of production. It reaches its highest strength according to the specifications after 7 days only of production.
- Other stones may be produced upon the customer's request and as per the requested quantity and the capacity of the factory.

Interlock Kerbstone

90330/1

This product introduces a new idea for tiling because of its many properties like:

- Using a new technique in installing the fence stones by the interrelation system without the need for the concrete used to link the stones together and to fill the spaces.
- The lower height of the stone makes it easy to install the stone at the same level of the tiles and the agricultural area. This is a new technique in paving squares.
- The cost is less because of the size of the product. Then, the selling price is less.

Interlock Corner Kerbstone

903400

Rain Drainage Stone

701400

- For main roads projects to drain rainwater to the manholes of the main line.
- Can be used in private housing to drain rainwater and prevent damage to the kerbstone.
- For farms, to transfer water for irrigation.
- Absorbance does not exceed 3% in 30 minutes, Density is 2350 kg/m³

- Forms Available: Cement & White

Wheel Stoppers Concrete Balls Traffic Columns

Wheel Stoppers, concrete balls and traffic columns are used for protecting parking pavers against damage and accidents.

Wheel stoppers are available in cement color only while concrete balls are available in several colors beside their marble and regular styles.

Concrete Balls

10231

- Weight: 120 kg
- Dimensions: 52x45 cm
- Available in several colors
- Available as regular and Marbles styles

Physical Specs of wheel stoppers

- Hole Diameter for all sizes is 5cm
- Concrete Grade is 400 kg/cm²
- Density is 2.47 g/cm³

Usage

1. Clean the place out of impurities
2. Location should be determined taking into account the appropriate dimensions of the wheel stopper and its most appropriate width according to the size of each car.
3. Drill a slot in the ground using electric drill to get the required size, noting that the diameter of the required slot should be 5 cm
4. Use a suitable nail in the slot
